

CLINIC MANAGEMENT SYSTEM

ABSTRACT

A clinic is a health care facility that is primarily devoted to the care of all patients. Clinic can be privately operated or publically manage and funded and typically care their primary health care needs of population in local communities, in contracts to larger hospital which gives specialized treatment and admit in patient box our night stays . Some clinic grows to be institution as larger as major hospitals, or become associated with hospitals or medicals school, while retaining the name “clinic”.

Clinic management includes information about admit patients, outdoor patients (OPD) status, outdoor patients appointments. Maintaining these information manually is time consuming and not suitable for clinics where number of appointment increases.

EXISTING AND PROPOSED SYSTEM

Now a day we see that the different types of disease are created. So that the one has to cover the much more distance in very short time. It leads to much physical stress and also much more expense. As the medical, hospitals, pathologies laboratories are very far from each other it takes more time, money and efforts to a patient.

We are providing the clinic which has all the facilities under one roof and also the website to get all the information about hospital. To get information about appointment at doctors and provide better facilities.

SYSTEM REQUIREMENT

Software and Hardware Requirement:

Requirement specifies the actual minimum requirements of hardware and software for the functioning of whole application.

Software requirement:

Microsoft Visual Studio 2005 or above version

.Net framework 2.0

IIS server (Internet Information Services)

MS_ACCESS

Web Browser (such as IE , Mozilla firefox)

Operating system: Windows XP / Windows 7

Minimum Hardware requirement:

RAM : 512 MB

HDD : 40GB

Processor : Pentium IV

ibase
